January 12, 2007

Mr. Martin Dies  
Dies & Hile, LLP  
1601 Rio Grande, Suite 330  
Austin, Texas 78701

Re: Expert Report

Dear Mr. Dies:

Enclosed please find the Supplemental Expert Report rendered by Construction Inspectors, Inc. Please advise if we provide you with any additional information.

  
Kenneth Pigg  
President

## **CONSTRUCTION INSPECTORS, INC. SUPPLEMENTAL EXPERT REPORT**

### **A. INTRODUCTION**

Construction Inspectors, Inc. ("CI") was retained by Dies & Hile, LLP to inspect various buildings, take bulk samples of surfacing materials and to quantify or assist in quantifying those materials identified as having been manufactured by W.R. Grace & Co. ("Grace"). We may offer testimony regarding the buildings listed in Exhibit "A" (the "Buildings at Issue"). These buildings have been identified as containing or having contained asbestos-containing acoustical plaster and/or fireproofing materials ("ACSTM") manufactured by Grace. We may also testify as to the procedures followed by CI in inspecting the Buildings at Issue, obtaining bulk samples of ACSTM, quantifying the ACSTM, assessing the condition of the Grace ACSTM, and the kinds of typical building activities that might impact or disturb the in-place ACSTM in the Buildings at Issue during normal building use and activities.

### **B. QUALIFICATIONS**

1. Tom Manning. I am an accredited Asbestos Building Inspector, in accordance with the requirements of the U.S. Environmental Protection Agency, Asbestos Hazard Emergency Response Act (AHERA). A substantial part of my professional practice has been devoted to inspecting, quantifying, assessing and determining the appropriate responses to ACSTM. I have inspected hundreds of buildings during the past 5 years for the purpose of determining whether they contain or contained ACSTM, for collecting bulk samples of suspect materials, and quantifying the amount of the ACSTM in issue.

2. John Mertian. I am an accredited Asbestos Building Inspector, in accordance with the requirements of the U.S. Environmental Protection Agency, Asbestos Hazard Emergency Response Act (AHERA). I am also an accredited Air Monitor Technician in accordance with the requirements of the U.S. EPA. A substantial part of my professional practice has been devoted to inspecting, quantifying, assessing and determining the appropriate responses to ACSTM. I have inspected hundreds of buildings during the past 10 years for the purpose of determining whether they contain or contained ACSTM, for collecting bulk samples of suspect materials, and quantifying the amount of the ACSTM in issue.

3. Kenneth Pigg. I am an accredited Asbestos Building Inspector, in accordance with the requirements of the U.S. Environmental Protection Agency, Asbestos Hazard Emergency Response Act (AHERA). I served in the United States Air Force where I was a quality control inspector with responsibility for minuteman missile nuclear warheads and guidance systems. I received an Air Force commendation for outstanding technical ability. I have approximately 40 years of experience in various aspects of the construction industry. A substantial part of my professional practice has been devoted to inspecting, quantifying, assessing and determining the appropriate responses to ACSTM. I have inspected hundreds of buildings during the past 15 years for the purpose of determining whether they contain or

contained ACSTM, for collecting bulk samples of suspect materials, and quantifying the amount of the ACSTM in issue.

### **C. MATERIALS REVIEWED**

Prior to the inspections of the Buildings at Issue, we were often provided access to the original plans, available information concerning any renovations of the buildings to be inspected, prior surveys of asbestos-containing building products, and other materials that contained information regarding asbestos containing building products in such buildings. Following our submission to Materials Analytical Services, Inc. ("MAS") of the bulk samples taken from the Buildings at Issue, CI was provided with the MAS reports which identified the manufacturer of the ACSTM in such buildings.

### **D. PROCEDURES FOLLOWED IN INSPECTING THE BUILDINGS, COLLECTING BULK SAMPLES, QUANTIFYING ACSTM, AND ASSESSING THE CONDITION OF THE ACSTM**

The Buildings at Issue, which are identified in Exhibit "A" have been inspected on one or more occasions by CI. Customarily, CI sent at least two individuals to conduct the initial inspections and bulk sampling. Prearrangements were made for representative(s) of the building owner, whose job duties included addressing asbestos issues, to accompany us and provide information and assistance in performing the inspection and obtaining bulk samples.

The following is a brief description of the actions taken in inspecting the buildings, collecting bulk samples of ACSTM, identifying the manufacturer of the ACSTM, and quantifying the amount of ACSTM manufactured by Grace. The initial inspection and bulk sampling for each building included the following:

- Review documents regarding construction of buildings, renovations to buildings and prior surveys for asbestos-containing materials, to the extent that such documents were available;
- Conduct a general walk through of the building identifying surface treatment materials;
- Identify the locations of spray-applied acoustical plaster and fireproofing products in the building;
- Determine the homogenous sampling areas for the spray-applied acoustical plaster and fireproofing products;
- Determine the number of bulk samples to be taken;
- Collect bulk samples of acoustical plaster and fireproofing suspected to contain asbestos from respective homogeneous sampling areas;
- Obtain information necessary to complete a Bulk Sample Data Sheet for each bulk sample collected;<sup>1</sup>

---

<sup>1</sup> The Bulk Sample Data Sheet identifies the building owner, building name, date sampled, sample number, person taking sample, sample location, material location, substrate and sketch of sample location.

- Complete Bulk Sample Data Sheet and Chain of Custody Log,<sup>2</sup> and forward bulk sample and documentation to CI's office for review and evaluation;
- Representative from CI reviewed and split samples; and
- Bulk sample, along with Chain of Custody form, were forwarded to MAS for analysis.

MAS determined whether the bulk sample contains asbestos, and if so, the manufacturer of the acoustical or fireproofing material. A second inspection of buildings in which asbestos-containing acoustical plaster or fireproofing was identified as having been manufactured by Grace was generally undertaken.<sup>3</sup> The second inspection included or resulted in some or all of the following:

- identify the homogeneous sampling area where the bulk sample identified by MAS as having been manufactured by Grace is located;
- confirm the homogenous sampling area that contains or contained Grace ACSTM;
- determine the quantity of Grace acoustical plaster or fireproofing in the homogenous area;
- review building plans and structural drawings, as needed, to make final determination of quantity of Grace ACSTM;
- assessing the condition of the Grace ACSTM and determining the appropriate AHERA category for such material;
- preparing a report identifying the location and quantity of the Grace ACSTM, and if a hazard assessment was conducted, identifying the appropriate AHERA category; and
- providing information and opinions concerning the existence, location, and quantity of ACSTM in the Buildings at Issue to representatives of Gobbell Hayes Partners, Inc.

Under AHERA, the visual and physical assessment method is the primary assessment tool. The inspector assesses the condition of the material and classifies the material according to one of several hazard categories. Factors which are considered in the assessment of the condition of the material include deterioration or delamination and physical damage to the material, water damage, accessibility and building activity. EPA discourages the use of air sampling, and makes it clear that air sampling can never be used, as a primary assessment methodology.

## **E. FINDINGS AND OPINIONS**

The opinions set forth below are based on our survey of the ACSTM and bulk sampling for product identification, the results of the constituent analysis of bulk samples by MAS, the quantification of material which was identified by MAS as representing a Grace product, and in

<sup>2</sup> The Chain of Custody Log identified the building owner, name of building, building address, the sample number, sample type, date sampled, sample location and the name of the person collecting the sample. It also provides a place for the signature of the custodian of the same, date sample received, the representative of the building owner from whom the sample was received, the person transferring the same, the date the sample was transferred and the mode of transfer.

<sup>3</sup> In a few instances the quantity of acoustical plaster or fireproofing within a homogenous sampling area was quantified at the time of the initial inspection.

those buildings for which we performed an AHERA assessment, the results of such assessments. Our opinions are as follows:

- Grace ACSTM is present in each of the buildings identified in Exhibit "A";
- the Grace ACSTM in the buildings identified in Exhibit "A" is friable in accordance with the EPA definition, in that the material may be crumbled, pulverized, or reduced to powder by hand pressure;
- the information, findings, and data in our individual asbestos inspection reports prepared by CI are hereby incorporated by reference as if fully set forth herein.

Date: January 12, 2007.

Tom Manning

John Mertian

Kenneth Pigg
